Cover image: The figure on the cover (from Amirahmadi et al, page 1900) shows a light microscopic image of bovine chondrocyte cultures stained with toluidine blue, used to assess the in vitro effects of murine monoclonal antibodies to type II collagen. Analyzing the effects of antibodies in the absence of mediators of inflammation provides insights into the epitope specificity of arthritogenic antibodies and the mechanisms by which antibodies can promote inflammation and cartilage damage in the collagen-induced arthritis model.
