ARP Announcements ................................................................................................................................. A15

Cover image: Cover images (from Khawar et al, pages 602 and 605): The image at left is a hand radiograph at admission showing extensive, prominent periosteal and joint capsular calcifications involving all of the phalanges, metacarpal bones, carpal bones, and the distal radius and ulna of the left hand, with the most prominent calcifications adjacent to the joints. There is marked soft tissue swelling around the metacarpophalangeal, proximal, and distal interphalangeal (IP) joints, as well as periarticular osteopenia. The image at right is a hand radiograph taken 8 months from time of discontinuation of voriconazole showing substantial improvement in the diffuse bilateral proximal interphalangeal (PIP) joints and distal IP joints. A small amount of residual periostitis is seen in the bilateral carpal bones and PIP joints.
