**Cover image:** The figure on the cover (from Li et al, pages 1266–1277) shows accelerated progression of posttraumatic osteoarthritis in the absence of small proteoglycan, decorin, following destabilization of the medial meniscus. By 8 weeks after medial meniscus destabilization, 3-dimensional micro-computed tomography reveals salient osteophyte formation (arrowheads) in decorin-null murine knees, illustrating more severe osteoarthritis than in wild-type controls.
