**Cover image:** The figure on the cover (from Zuo et al, pages 2130–2135) illustrates the detection of anti-neutrophil extracellular trap (NET) antibodies from patients with primary antiphospholipid syndrome, by immunofluorescence microscopy. When NETs were incubated with plasma from patients with high levels of anti-NET IgG, antibodies robustly decorated NET strands. DNA stained blue, neutrophil elastase stained green, and human IgG stained red. This is a merged image.
